

UNIVERSITY OF
BIRMINGHAM

Cross-domain Ultrasound Classification

Dr Qingjie Meng

School of Computer Science

University of Birmingham

Outline

- Ultrasound imaging
- Fetal ultrasound classification
- Domain shift in fetal ultrasound screening
- Cross-domain fetal ultrasound classification

Ultrasound imaging

Advantages:

- Portability
- Low cost
- Real-time imaging capability
- No radiation exposure
- ...

Disadvantages:

- Low image quality and details
- ...

Ultrasound imaging

Fetal ultrasound classification

Area	Anatomies	
Head	Brain (cb.)	Brain view at the level of the cerebellum
	Brain (tv.)	Brain view at posterior horn of the ventricle
Facial Features	Lips	Coronal view of lips and nasal tip
Heart	4CH	Four chamber view
	3VV	Three vessel view
	RVOT	Right ventricular outflow tract
	LVOT	Left ventricular outflow tract
Abdominal content	Abdominal	Standard abdominal view at stomach level
	Kidneys	Axial kidneys view
Spine	Spine (sag.)	Sagittal spine view
	Spine (cor.)	Coronal spine view
Limb	Femur	Standard femur view
Others	Profile	Median facial profile

Categories of scan planes required by NHS

- a) Baumgartner, et al. SonoNet: Real-Time Detection and Localisation of Fetal Standard Scan Planes in Freehand Ultrasound.
<https://ieeexplore.ieee.org/abstract/document/7974824>
- b) Sarker, et al. COMFormer: Classification of Maternal–Fetal and Brain Anatomy Using a Residual Cross-Covariance Attention Guided Transformer in Ultrasound.
<https://ieeexplore.ieee.org/abstract/document/10239175>
- c) Burgos-Artizzu, et al. Evaluation of deep convolutional neural networks for automatic classification of common maternal fetal ultrasound planes.

Domain shift in ultrasound imaging

Different data distribution
with artifacts versus without artefacts

Device A

Device B

Histogram

Different acquisition device

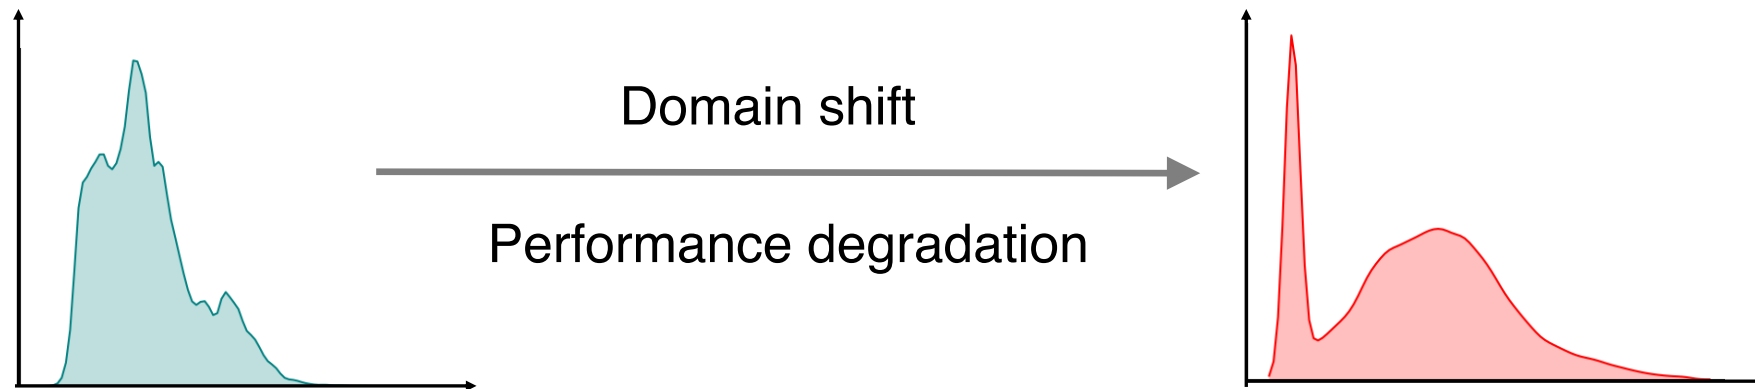

Cross-device fetal ultrasound classification

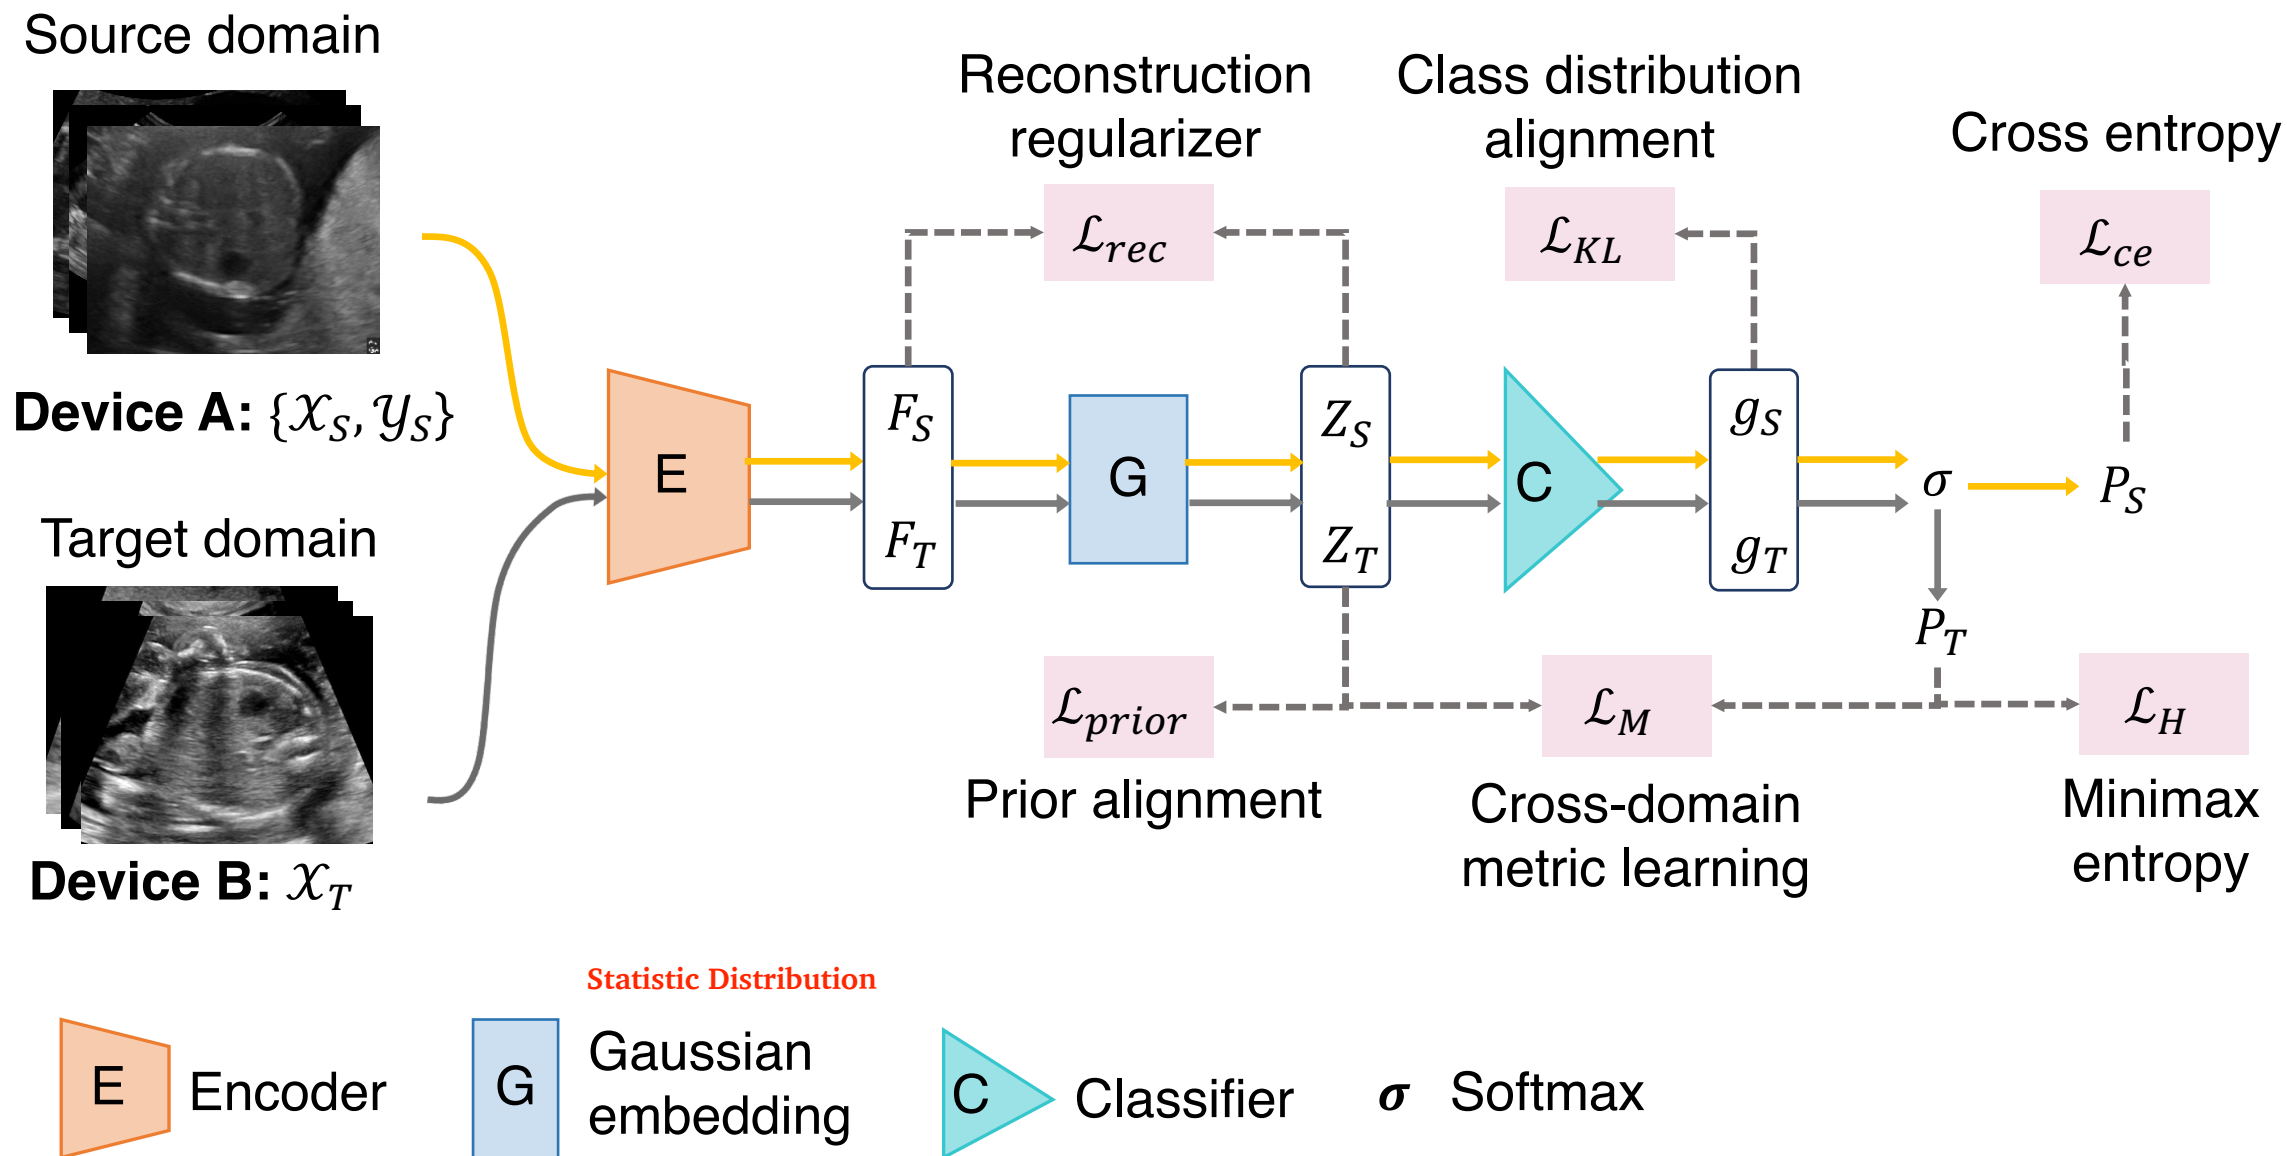

Device A: GE Voluson E8

Device B: Philips EPIQV7 G

Cross-device fetal ultrasound classification (model training)

Cross-device fetal ultrasound classification (model test)

Source domain

Device A: $\{\mathcal{X}_S, \mathcal{Y}_S\}$

Target domain

Device B: \mathcal{X}_T

Results

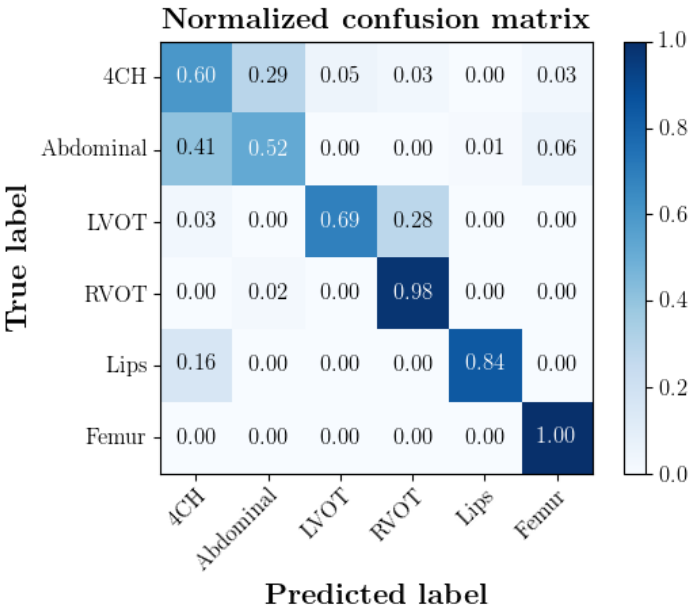

Method	Source domain: Device A			Target domain: Device B		
	F1-score	Recall	Precision	F1-score	Recall	Precision
Source only	0.8782	0.8800	0.8786	0.2455	0.3400	0.3070
ADDA	0.8841	0.8850	0.8860	0.1377	0.2050	0.1623
DANN	0.8321	0.8350	0.8564	0.3390	0.3650	0.3756
MME	0.8876	0.8900	0.8914	0.4398	0.5133	0.4565
Ours	0.8990	0.9000	0.9027	0.7713	0.7717	0.7874

$$F1 = \frac{TP}{TP + \frac{1}{2}(FP + FN)}$$

$$Recall = \frac{TP}{TP + FN}$$

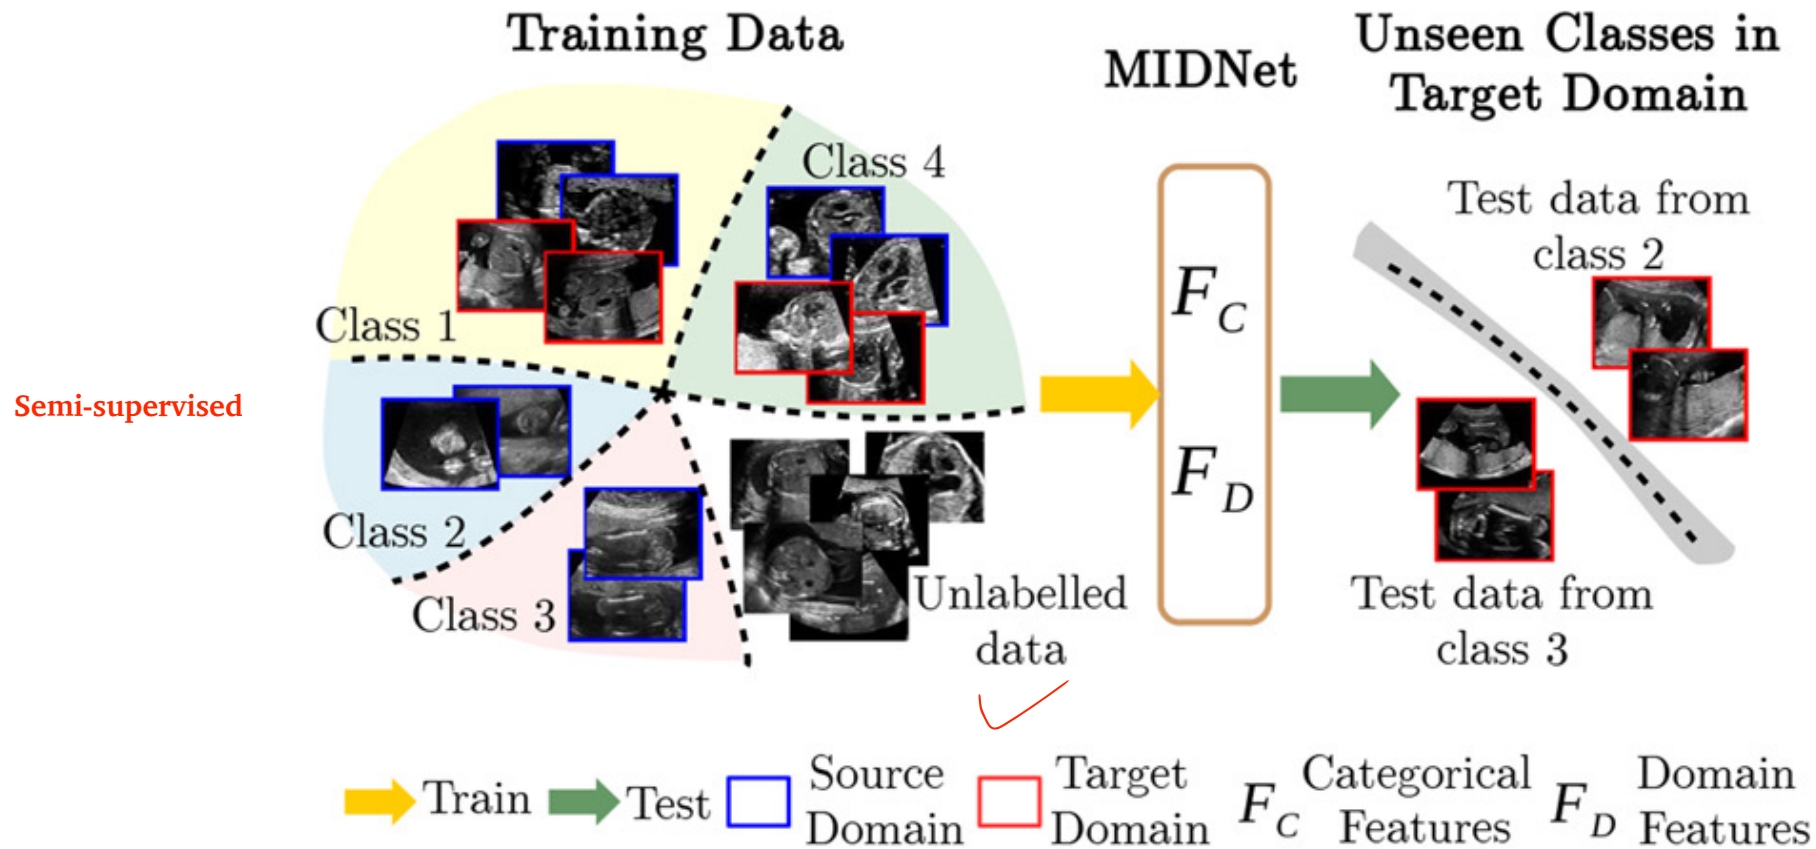

$$Precision = \frac{TP}{TP + FP}$$

TP: True positives
FP: False positives
FN: False negatives

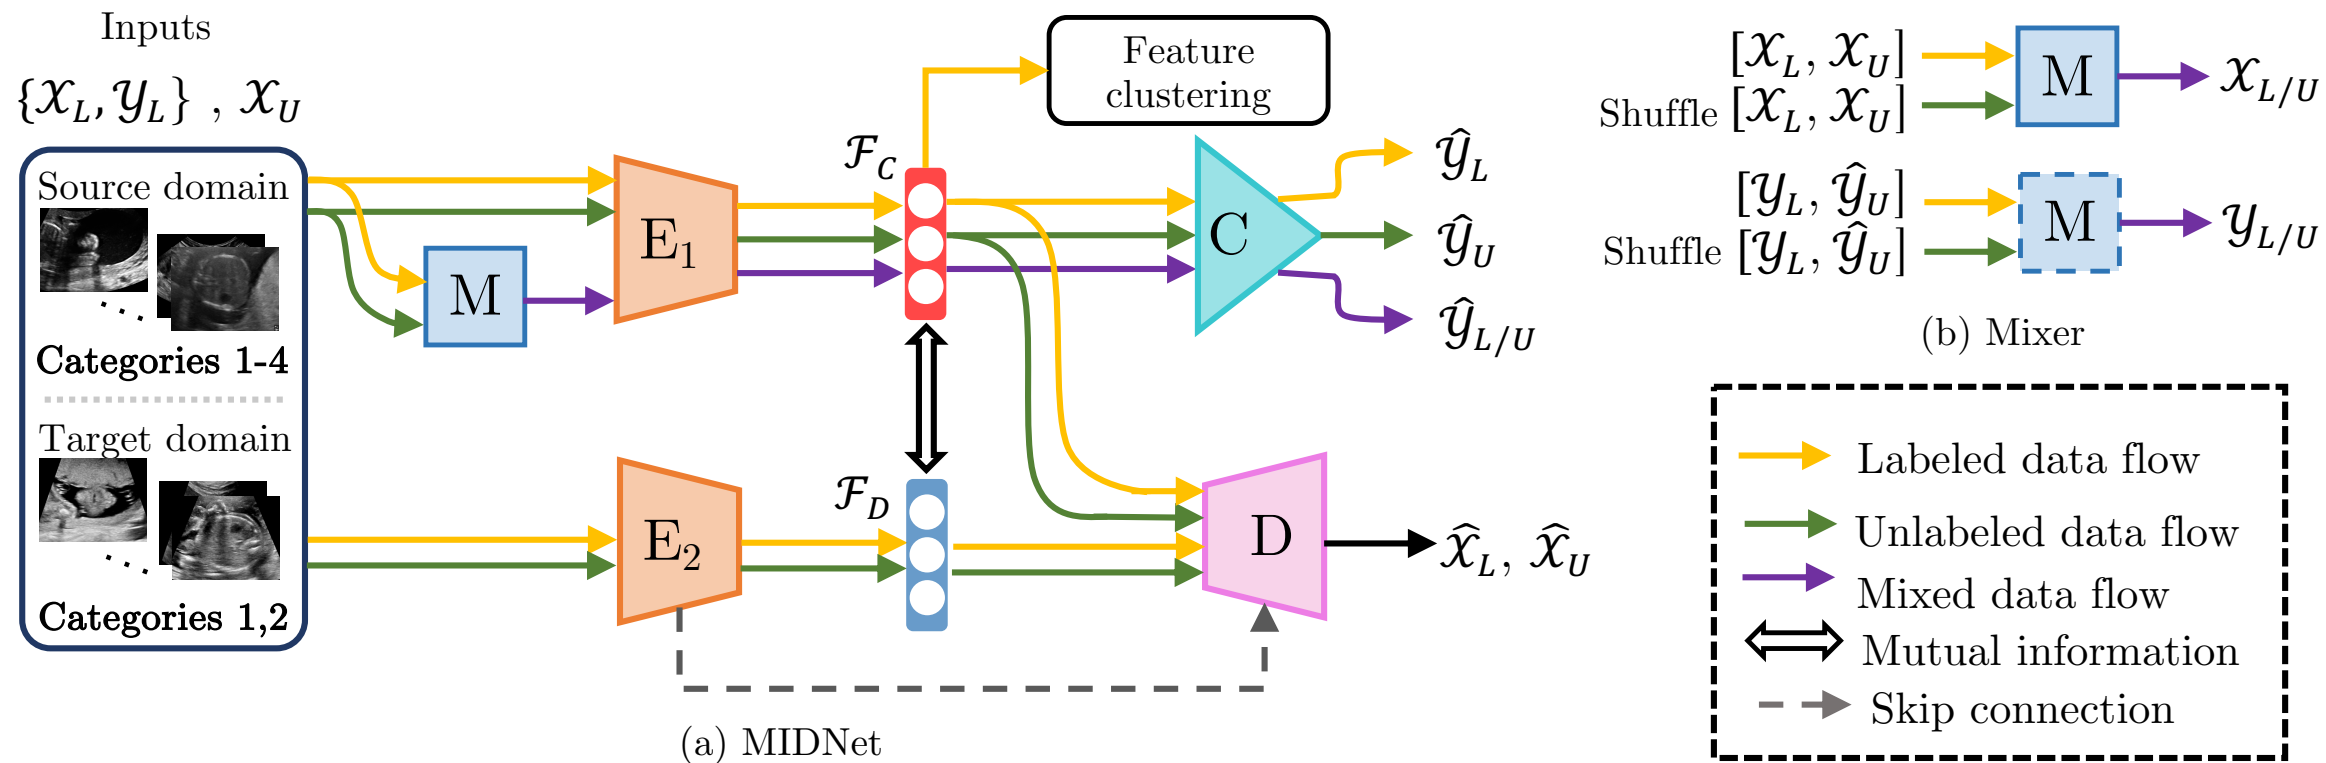

One step further

How about different categories in different domains?

Model training

Results

Methods	T_{Target}^{New}		
	F1-score	Recall	Precision
Source only	0.6742	0.7050	0.6899
